        Title
Jan Parget sum
          Description
             You are given a list of integers, and your task is to write a function that finds the two numbers in the list that add up to a specific target sum. You need to retum the indices of
             these two numbers.
                                                                                                                                                    5R23CD010
             Write a function that takes a list of Integers and a target sum as input and returns a list of two indices (O-based) of the numbers that add up to the target sum. Assume that
             there is exactly one solution, and you cannot use the same element twice
             Sample Input:
             2 7 11 15
             Sample Output:
             [0, 1]

                                                                                                           3BP23V
             def two_sum(nums, target):
070382236
               num_to_index = {}
               for i, num in enumerate(nums):
                  complement = target - num
                  if complement in num_to_index:
                    return [num_to_index[complement], i]
                  num_to_index[num] = i
               raise ValueError("No two numbers add up to the target sum.")
             nums = list(map(int,input().split()))
             target = int(input())
             indices = two_sum(nums, target)
             print(indices)
        RESULT
          5 / 5 Test Cases Passed | 100 %
